

4th week-

We started the 4th week by installing Windows WSL (Windows Subsystem for Linux) on our desktops. We were encouraged to use free and open-source software as it gives us more control on our device. And why powershell because we have become too much dependent on double clicking which takes away our control from our own device.

We practiced running commands in WSL, but at first, I had no idea how it worked. I was just copying and pasting whatever commands the instructor gave us. When I tried opening the apps through PowerShell, it kept throwing errors. That's when we learned that the computer doesn't automatically know everything, we have to specify locations for commands to work by modifying environment variables. Environmental variables, powershell, and commands were all the new learning from this week.
