5th week-

In the fifth week of our course, we learned more about using PowerShell to perform basic tasks on our laptops. Continuing to learn Powershell made a lot of things clear that were not so clear last week. We started with simple commands to open applications(like, Notepad, Chrome, etc), copy and paste files, and move files from one directory to another using the mv command.

Creating new directories with mkdir. These were the basics but still it was fun to learn. We also learned some essential commands like cd -change directory and pwd-print working directory, and many more. These commands clarified how the file system is structured and how to move around within it. We also learnt about the editor "Pico".
